Title : Process approach in reducing Medication Errors

Authors: Dr. Sanjeev Sharma – Clinical Pharmacologist Mr. Satish Kumar – Chief Quality Officer

Introduction

The National Coordinating Council for Medication Error Reporting and Prevention (NCCMERP) has defined medication errors (MEs) as, "Any preventable event that may cause or lead to inappropriate medication use or patient harm, while the medication is in the control of the health care professional, patient, or consumer.

Based on our medication errors analysis and subsequent discussion in our Drug and Therapeutic Committee, it was highlighted that our medication error rate was higher than the ISMP Benchmark. It was analysed that majority of the errors were due to:

wrong dose, decimal & numbering, therapeutic duplication, wrong frequency and dilution errors.

The contributing factors were Drug knowledge dissemination, Poor handwriting, Inexperienced staff, challenging patient populations, Lack of follow-up and monitoring, Medication calculations, and ineffective communication.

At the start of the project, our medication error rate was 2.60 % and we started with a goal of 30% reduction and move continuously towards the final aim of zero error.

Improving the safety of medication and reducing errors, we were able to develop safe medication practices across the hospital and reduce the chances of adverse events. This ultimately added to ideal and harmless patient care, contributing a lot towards patient safety.

With implementation of various interventions we were able to reduce errors from 2.60% in 2012 to 1.40 % in 2021

Problem Definition

Medication errors have significant implications on patient safety.

Error detection discloses those errors and thus, encourages a safe culture.

At the initiation of the project in 2012 our medication error rate was 2.60 % much higher than the ISMP target of less than 2%. Hence we decided to reduce the same by at least 30% which when achieved was further increased to 50% (approximately) and further work towards achieving 0 medication error.

Objective

The objectives of this project were to identify and analyze the types of medication errors and undertake interventions to avoid such errors

To reduce the risk of patient harm by reducing medication errors and improving patient safety following goals were undertaken

- Identification of the most common errors related to medications.
- Reviewing critical points at which medication errors are most likely to occur.
- Outlining strategies to prevent medication errors from occurring.
- Summarizing inter-professional team strategies for decreasing medication errors.

Concept Note

A dedicated team of experts from medical administration, quality cell, nursing and clinical pharmacology was formulated to study medication error trends and potential causative factors associated. Medication management process was mapped thoroughly followed by extensive brain storming on causative factors and depiction of cause and effect diagram to segregate the related causes. Potential solutions pertaining to causative factors were chalked down and discussed with respective process owners for effective implementation. Medication error trends before and during the implementation process were observed for impact analysis. Sustained efforts were put in place for effective measures while medication errors were tracked and analysed continuously.

A Root Cause Analysis... Prescription Error Transcription Error Medication Drug prescribed in Indenting incorrect dose/routerfrequency spite of allergy indenting two medicine dose/ written wrongly in the brands for single route/ frequency/ Different brands containing drug chart diution same active drug or same misuse of zeroes and Wrong medicine Indent raised category drug decimal points while name entered Wrong dilution or twice prescribing medicine. during indenting dilution not mentioned Excess quantity medicine Medication Doctor did not write the indented dose/route/dilution medicines in the drug not mentioned chart Medication administered to patient Dispensing an in an time different from that which incorrect drug Dispensing wrong Administering had been prescribed dose medication to a patient despite Confusion between Wrong dose administered allergy similar drug names Missed dose Dose administered at a different diution than prescribed Administration Error Dispensing error

Methodology

Based on the findings, following interventions were suggested and implemented as and when required; at the same time regular tracking of medication error was continued for assessment of improvement and to suggest further interventions.

- Mapping the medication process
- Weekly error reporting process
- Trend analysis for medication error
- Segregation of types of errors
- Strengthening Auditing process
- New indenting module
- Separation of look or sound alike drugs
- Tall Man lettering to identify LASA drugs
- Light verification methodology for cross checking the IV fluids
- Order rechecking process by pharmacist
- Disturbance-free-indenting and Collaborative Rounds process on weekly basis
- Staff re-orientation programs
- Intensified training and Regular ongoing sessions for medical staff and Nursing
- Strengthening the medication re-conciliation process
- Pocket sized drug formularies to all doctors
- Online access to drug formulary and drug information software
- Customized drug chart
- Staff engagement activities on medication safety

- Fun activities

NO ERROR MONTH CALENDAR

A pre-printed calendar was given to all patient care areas and the in charge was told to mark the error free day with green and even a single error in day was marked as red. The unit were then awarded based on maximum no of green days.

SIMULATION TRAINING

A fun filled exercise for all Healthcare Providers, wherein based on the Errors set-up, the employees need to correctly find out the errors and fill their responses in the online quiz

Medication Safety Month April 2021 Safety is best Medicine.

Let everybody know how you ensure Medication Safety in your area. Make a photo collage showcasing Medication Safety Practices. Share it with us at

NO ROOM FOR ERRORS!

LETS TRY OUR BEST TO SPOT ALL ERRORS WHICH MIGHT COME IN OUR WAY OF PROVIDING OUR PATIENTS WITH THE BEST OF CARE

GLIMPSE OF MEDICATION SAFETY WEEK

Day 1 - Education on Rational use of Antibiotics, Safe use of Antibiotics, Avoiding common mistakes, and Hand Hygiene. Quiz on Medication Safety particularly High Alert Drugs. Updated list of all High Alert Drugs were also given for display.

Day 2 – Nurses training on Medication Safety, Medication Reconciliation, DVT Awareness, and Simulation exercise on auditing points for Pharmacists

Day 3 - Pharmacist training on Appropriateness Review, Medication Reconciliation and Prescription Audit, Insulin Rainbow – to colour according to the Type of Insulin by the Pharmacy and Nursing Staff

Day 4 - DVT training for Doctors, Find the error exercise for the Pharmacist

Day 5 - Training of Doctors on DVT Prevention / Medication Safety Prevalence of DVT, Sign and Symptoms, Prevention Methodologies, Treatment Guidelines

Medication Safety: Doctor's Perspective – High Alert Drugs, Prescription Errors, Stoppage /Discontinuation/Change of Drugs orders, Medication Reconciliation, Appropriateness Review of Drugs

Day 6 - Based on the prescription audit findings, HODs recommendations and Quiz results, the team identified the Medication Safety Champions - 2 Doctors, 2 Nurses and 2 Clinical Pharmacists, who were felicitated by the Senior Management Team. The winners were appreciated by the management and requested to become Champions for other healthcare providers.

Medication Safety Tips

- 1. Always understand the use of your medicines from the doctor/pharmacist.
- 2. Keep a list of all your medications handy.
- 3. Inform your food/drug allergy to your doctor.
- 4. Ask about changes in colour/shape of your regular drugs.
- Please inform your doctor about the herbal/over the counter drug you may be taking.
- Always understand whether to take the drug before /after food from your doctor/pharmacist.
- 7. Always take your medicines with water preferably in an upright position.
- 8. Store your medicines away from direct sunlight and children.
- 9. Please speak to your doctor/pharmacist in case you feel anything not going right.
- 10. Please do not take medicines on your own, always follow a fresh medical advice.

Patient Safety Day 17 September

Power back up

Fire Safety

Committed to Safer Healthcare

Tangible Results

Intangible Results

- Cost reduction of resources wasted in overcoming the damage due to errors.
- Reducing the length of stay improved the patient satisfaction
- Reduction in stress level, burn out in employees
- Promoted organizational goal of continuous quality improvement
- Increased compliance to the accreditation standards

Way forward

COMPUTERIZED PHYSICIAN ORDER ENTRY

Future p	lans, i	f any:
----------	---------	--------

Some of the strategies that have been proposed and tested to minimize risks include:

- In future with CPOE tall man lettering for prescription in CPOE shall enable to alert staff about LASA drug- Computerized alerts can be introduced into dispensing software to alert the user to potential LASA medication pairs and to intercept LASA errors.
- Real time Safety Alert for LASA drugs at the time of prescription, transcription, dispensing, administration and monitoring for alertness will be a leap forward in further preventing LASA medication errors.
- Bar-code-assisted medication administration will take us to further reducing LASA medication errors.
- Creating common database of all LASA medications in Apollo ecosystem will help in strengthening it to next level.
- The joint use of the brand name and the generic name (in brackets) in prescriptions and drug labeling- CURRENTLY ON LASA medication label brand name and generic name along with indication is mentioned, but prescription currently doesn't have all these details- Implementation of CPOE will enable to do so.

MEDICATION SAFETY AUTOMATION

Conclusion

This project provided us deep insight into our processes and gave us the platform to fill the gaps and strengthen our system and processes continuously.

Improving the safety of medication and reducing errors, we were able to develop safe medication practices across the hospital and reduce the chances of adverse events. This ultimately added to ideal and harmless patient care, contributing a lot towards patient safety.

By the way of successful integration of all interventions and regular assessments, medication error rate has been brought down significantly. However, target shall be 'zero'; as it's an ongoing journey where continuous vigil and enforcement remains the key to minimize the unintentional but significant harm.

Acknowledgment

The team:

- Leadership
- Clinical pharmacologist and his team
- Medical services
- Nursing team
- Quality team
- CAHO for providing the platform to showcase the practices we do.

Any Questions
